

4.6

Model Direct Variation

Goal • Write and graph direct variation equations.

Your Notes

VOCABULARY

Direct variation The relationship of two variables, x and y , provided $y = ax$ and $a \neq 0$

Constant of variation In $y = ax$, a is called the constant of variation.

Example 1 Identify direct variation equations

Tell whether the equation represents direct variation. If so, identify the constant of variation.

a. $4x + 2y = 0$

b. $-2x + y = 3$

Solution

To tell whether an equation represents direct variation, try to rewrite the equation in the form $y = ax$.

a. $4x + 2y = 0$

Write original equation.

$$2y = -4x$$

Subtract $4x$ from each side.

$$y = -2x$$

Simplify.

Because the equation $4x + 2y = 0$ can be rewritten in the form $y = ax$, it represents direct variation. The constant of variation is -2 .

b. $-2x + y = 3$

Write original equation.

$$y = 2x + 3$$

Add $2x$ to each side.

Because the equation $-2x + y = 3$ cannot be rewritten in the form $y = ax$, it does not represent direct variation.

Your Notes

✓ **Checkpoint** Tell whether the equation represents direct variation. If so, identify the constant of variation.

1. $3x + 4y = 0$ yes; $-\frac{3}{4}$	2. $5x + y = 1$ no
---	-----------------------

Example 2 Graph direct variation equations

Graph the direct variation equation.

a. $y = -5x$

b. $y = \frac{3}{5}x$

Solution

- a. Plot a point at the origin. The slope is equal to the constant of variation, or -5 . Find and plot a second point, then draw a line through the points.

- b. Plot a point at the origin. The slope is equal to the constant of variation, or $\frac{3}{5}$. Find and plot a second point, then draw a line through the points.

The graph of a direct variation equation is a line with a slope of a and a y -intercept of 0. This line passes through the origin.

Your Notes

Example 3 Write and use a direct variation equation

The graph of a direct variation equation is shown.

- Write the direct variation equation.
- Find the value of y when $x = 80$.

Solution

- Because y varies directly with x , the equation has the form $y = ax$. Use the fact that $y = -3$ when $x = -4$ to find a .

$$y = ax$$

Write direct variation equation.

$$\underline{-3} = a(\underline{-4})$$

Substitute.

$$\underline{\frac{3}{4}} = a$$

Solve for a .

A direct variation equation that relates x and y is

$$y = \underline{\frac{3}{4}x}.$$

- When $x = 80$, $y = \underline{\frac{3}{4}(80)} = \underline{60}$.

✓ Checkpoint Complete the following exercises.

- Graph the direct variation equation $y = \frac{1}{2}x$.

- The graph of a direct variation equation passes through the point $(3, -4)$. Write the direct variation equation and find the value of y when $x = 15$.

$$y = \underline{-\frac{4}{3}x}; y = \underline{-20}$$
