## Algebra 2

## 4-03 Divide Polynomials (4.3)

## Polynomial Long Division

1. Set up the division problem. $\qquad$ ——_
2. $\qquad$ the $\qquad$ term of the dividend by the $\qquad$ term of the divisor.
3. $\qquad$ the answer by the divisor and write it below the like terms of the dividend.
4. $\qquad$ the bottom from the top.
5. $\qquad$ the next term of the dividend.
6. $\qquad$ steps 2-5 until reaching the last term of the dividend.
7. If the remainder is not zero, write it as a $\qquad$ using the divisor as the denominator.

## Synthetic Division

- 

—— form of long division for dividing by a $\qquad$

- Only when dividing by $\qquad$

## How to do Synthetic Division

To divide a polynomial by $x-k$,

1. Write $\qquad$ for the divisor.
2. Write the $\qquad$ of the dividend.
3. Bring the $\qquad$ coefficient down.
4. $\qquad$ the lead coefficient by $k$. Write the product in the next column.
5. $\qquad$ the terms of the second column.
6. $\qquad$ the result by $k$. Write the product in the next column.
7. $\qquad$ steps 5 and 6 for the remaining columns.
8. Use the bottom numbers to write the $\qquad$ . The number in the last column is the remainder, the next number from the right has degree 0 , the next number from the right has degree 1 , and so on. The quotient is always
$\qquad$ degree less than the dividend.

Algebra 2 4-03
Synthetic Division
$\left(-5 x^{5}-21 x^{4}-3 x^{3}+4 x^{2}+2 x+2\right) /(x+4)$
$\left(y^{5}+32\right) \div(y+2)$

173 \#1, 3, 5, 7, 9, 11, 13, 15, 21, 31, Mixed Review = 15
