$\qquad$

Roll your two dice 10 times. Calculate the experimental probabilities and draw a histogram.

| Sum | Probability |
| :--- | :--- |
| 2 |  |
| 3 |  |
| 4 |  |
| 5 |  |
| 6 |  |
| 7 |  |
| 8 |  |
| 9 |  |
| 10 |  |
| 11 |  |
| 12 |  |

1. Compare this histogram to the theoretical histogram?

$\qquad$

Roll your two dice 100 times. Calculate the experimental probabilities and draw a histogram.

| Sum | Probability |
| :--- | :--- |
| 2 |  |
| 3 |  |
| 4 |  |
| 5 |  |
| 6 |  |
| 7 |  |
| 8 |  |
| 9 |  |
| 10 |  |
| 11 |  |
| 12 |  |

2. Compare this histogram to the theoretical histogram?
3. Compare this histogram to the one you made by rolling the dice 10 times? Which is closer to the theoretical?
4. Make a conjecture about how closely the experimental probabilities would match the theoretical if you rolled the dice 1000 times.
$\qquad$

| Sum | Frequency (for 10 rolls) |
| :--- | :--- |
| 2 |  |
| 3 |  |
| 4 |  |
| 5 |  |
| 6 |  |
| 7 |  |
| 8 |  |
| 10 |  |
| 11 |  |
| 12 |  |

| Sum | Frequency (for $\mathbf{1 0 0}$ rolls) |
| :--- | :--- |
| 2 |  |
| 3 |  |
| 4 |  |
| 5 |  |
| 6 |  |
| 7 |  |
| 8 |  |
