6.1 PERPENDICULAR AND ANGLE BISECTORS

After this lesson...

- I can identify a perpendicular bisector and an angle bisector.
- I can use theorems about bisectors to find measures in figures.
- I can write equations of perpendicular bisectors.
6.1 PERPENDICULAR AND ANGLE BISECTORS

- **Perpendicular Bisector**
  - Segment that is perpendicular to and bisects a segment

**Perpendicular Bisector Theorem**
If a point is on the perpendicular bisector of a segment, then it is equidistant from the endpoints of the segment

**Converse of the Perpendicular Bisector Theorem**
If a point is equidistant from the endpoints of a segment, then it is on the perpendicular bisector of the segment
6.1 PERPENDICULAR AND ANGLE BISECTORS

• In the diagram, \( \overline{JK} \) is the perpendicular bisector of \( \overline{NL} \).

• Find \( NK \).

• Explain why \( M \) is on \( \overline{JK} \).

• Try #6

Since \( JK \) is perpendicular bisector, then \( NK = LK \) (perpendicular bisector theorem).

\[
6x - 5 = 4x + 1 \rightarrow 2x - 5 = 1 \rightarrow 2x = 6 \rightarrow x = 3
\]

Find \( NK \): \( 6x - 5 \rightarrow 6(3) - 5 = 13 \)

Since \( MN = ML \), \( M \) is equidistant from each end of \( NL \). Thus by then Converse of the Perpendicular Bisector Theorem, \( M \) is on the perpendicular bisector.
6.1 PERPENDICULAR AND ANGLE BISECTORS

- **Angle Bisector**
  - Ray that bisects an angle

**Angle Bisector Theorem**
If a point is on the angle bisector, then it is equidistant from the sides of the angle.

**Converse of the Angle Bisector Theorem**
If a point is equidistant from the sides of an angle, then it is on the angle bisector.
6.1 PERPENDICULAR AND ANGLE BISECTORS

• Find the value of \( x \).

\[
3x + 5 = 4x - 6 \rightarrow 5 = x - 6 \rightarrow x = 11
\]

\[
5x = 6x - 5 \rightarrow -x = -5 \rightarrow x = 5
\]

No, you need to know that \( SP \perp QP \) and \( SR \perp QR \)

• Try #14

• Do you have enough information to conclude that \( QS \) bisects \( \angle PQR \)?

• Try #10
6.1 PERPENDICULAR AND ANGLE BISECTORS

- **Write Equations of Perpendicular Bisector**
  1. Find midpoint
  2. Find slope
  3. Find \( \perp \) slope
  4. Write equation using slope from #3 and point from #1

- Write the perpendicular bisector of a segment with endpoints \( D(5, -1) \) and \( E(-11, 3) \)

- Try #20

1. **Midpoint:** \( M = \left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right) \rightarrow \left( \frac{5 + (-11)}{2}, \frac{-1 + 3}{2} \right) \rightarrow (-3, 1) \)
2. **Slope:** \( m = \frac{y_2 - y_1}{x_2 - x_1} \rightarrow \frac{3 - (-1)}{-11 - 5} = \frac{4}{-16} = -\frac{1}{4} \)
3. **\( \perp \) Slope:** \( m = 4 \)
4. **Equation:**
   
   \[
   y = mx + b \\
   1 = 4(-3) + b \\
   1 = -12 + b \\
   13 = b \\
   y = 4x + 13
   \]
6.2 BISECTORS OF TRIANGLES

After this lesson...
- I can find the circumcenter and incenter of a triangle.
- I can use points of concurrency to solve real-life problems.
Find the perpendicular bisectors of a triangle
Cut out a triangle
Fold each vertex to each other vertex
  • The three folds are the perpendicular bisectors
What do you notice?
  • Perpendicular bisectors meet at one point
Measure the distance from the meeting point to each vertex
What do you notice?
  • The distances are equal
6.2 BISECTORS OF TRIANGLES

- **Concurrent**
  - Several lines that intersect at same point (point of concurrency)

**Concurrency of Perpendicular Bisectors of a Triangle**

The perpendicular bisectors of a triangle intersect at a point that is equidistant from the vertices of a triangle.
6.2 BISECTORS OF TRIANGLES

- Hot pretzels are sold from store at A, B, and E. Where could the pretzel distributor be located if it is equidistant from those three points?

- Try #1, 4
6.2 BISECTORS OF TRIANGLES

• **Circumcenter**
  - The point of concurrency of the perpendicular bisectors of a triangle.
  - If a circle was circumscribed around a triangle, the circumcenter would also be the center of the circle.
Concurrency of Angle Bisectors of a Triangle

The angle bisectors of a triangle intersect at a point that is equidistant from the sides of a triangle.

**Incenter**

- Point of concurrency of the angle bisectors of a triangle
- If a circle was inscribed in a triangle, the incenter would also be the center of the circle.
6.2 BISECTORS OF TRIANGLES

• $N$ is the incenter. Find $EN$.

• Try #6, 12

Find $NF$ by using the Pythagorean theorem.

\[ 16^2 + NF^2 = 20^2 \Rightarrow 256 + NF^2 = 400 \Rightarrow NF^2 = 144 \Rightarrow NF = 12 \]

Since $N$ is the incenter, $NF = EN = 12$
6.3 MEDIANs AND ALTITUDES OF TRIANGLES

After this lesson...

• I can find the centroid of a triangle.
• I can find the orthocenter of a triangle.
6.3 MEDIANS AND ALTITUDES OF TRIANGLES

• **Median**
  • Segment that connects a vertex to a midpoint of side of a triangle.
  • Point of concurrency is called the centroid.
  • The centroid is the balance point.

**Concurrency of Medians of a Triangle**

The medians of a triangle intersect at a point that is two thirds of the distance from each vertex to the midpoints of the opposite side.
6.3 MEDIANS AND ALTITUDES OF TRIANGLES

- Each path goes from the midpoint of one edge to the opposite corner. The paths meet at $P$.
- If $SC = 2100$ ft, find $PS$ and $PC$.
- If $BT = 1000$ ft, find $TC$ and $BC$.
- If $PT = 800$ ft, find $PA$ and $TA$.

- Try #2, 6

\[
PC = \frac{2}{3}SC \rightarrow PC = \frac{2}{3}(2100) = 1400 \text{ ft} \rightarrow PS = 700 \text{ ft}
\]

*T is midpoint of $BC$. $TC = 1000$ ft, $BC = 2000$ ft*

\[
PT = \frac{1}{3}TA \rightarrow 800 = \frac{1}{3}TA \rightarrow 2400 \text{ ft} = TA, PA = 1600 \text{ ft}
\]
6.3 MEDIANS AND ALTITUDES OF TRIANGLES

* Find the coordinates of the centroid of $\triangle ABC$ with vertices $A(0, 4)$, $B(-4, -2)$, and $C(7, 1)$.

* Try #16

1. Graph the points
2. Find the midpoints of each side
   a. $M_{AB} = \left(\frac{0+(-4)}{2}, \frac{4+(-2)}{2}\right) = (-2, 1)$
   b. $M_{BC} = \left(\frac{-4+7}{2}, \frac{-2+1}{2}\right) = \left(\frac{3}{2}, \frac{-1}{2}\right)$
   c. $M_{AC} = \left(\frac{0+7}{2}, \frac{4+1}{2}\right) = \left(\frac{7}{2}, \frac{5}{2}\right)$
3. Connect each midpoint with the opposite vertex
4. The centroid is the intersection

(1, 1)
6.3 MEDIANs AND ALTITUDES OF TRIANGLES

**Altitudes**
- Segment from a vertex and perpendicular to the opposite side of a triangle.
- Point of concurrency is called the orthocenter.

**Concurrency of Altitudes of a Triangle**
The lines containing the altitudes of a triangle are concurrent.

- Acute $\Delta$ $\rightarrow$ orthocenter **inside** triangle
- Right $\Delta$ $\rightarrow$ orthocenter **on right angle** of triangle
- Obtuse $\Delta$ $\rightarrow$ orthocenter **outside** of triangle

There is nothing terribly interesting about the orthocenter.
In an acute triangle, the orthocenter is inside the triangle.
In a right triangle, the orthocenter is on the triangle at the right angle.
In an obtuse triangle, the orthocenter is outside of the triangle.
6.3 MEDIANS AND ALTITUDES OF TRIANGLES

- Find the orthocenter.

- Try #18

Draw the other two altitudes (from A and C). They will be outside the triangle.
6.3 MEDIANs AND ALTITUDEs OF TRIANGLES

- In an isosceles triangle, the perpendicular bisector, angle bisector, median, and altitude from the vertex angle are all the same segment.
6.3 MEDIANS AND ALTITUDES OF TRIANGLES

- Given: \(\triangle ABC\) is isosceles, \(BD\) is a median
- Prove: \(BD\) is an angle bisector

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>

Try #26
6.4 THE TRIANGLE MIDSEGMENT THEOREM

After this lesson...
• I can use midsegments of triangles in the coordinate plane to solve problems.
• I can solve real-life problems involving midsegments.
6.4 THE TRIANGLE MIDSEGMENT THEOREM

- Draw a triangle in your notes
- Find the midpoints of two of the sides using a ruler
- Connect the midpoints of the two sides with a segment
- Measure the segment and the third side
- What do you notice?
- What else do you notice about those two segments?

Length should be $\frac{1}{2}$
They should be parallel
Midsegment of a Triangle

Segment that connects the midpoints of two sides of a triangle

Midsegment Theorem

The midsegment of a triangle is parallel to the third side and is half as long as that side.
In \( \triangle RST \), show that midsegment \( MN \) is parallel to \( RS \) and that \( MN = \frac{1}{2} RS \).

Parallel (slopes):

\[
m_{MN} = \frac{2 - 0}{3 - 1} = 1 \\
m_{RS} = \frac{5 - 1}{2 - (-2)} = 1
\]

Distance:

\[
MN = \sqrt{(3 - 1)^2 + (2 - 0)^2} = 2\sqrt{2} \\
RS = \sqrt{(2 - (-2))^2 + (5 - 1)^2} = 4\sqrt{2}
\]
6.4 THE TRIANGLE MIDSEGMENT THEOREM

• Name the midsegments.

• Draw the third midsegment.

• Let \( UW \) be 81 inches. Find \( VS \).

• Try #8, 10

\[
UV, WV
\]

\[
UW
\]

\[
UW = \frac{1}{2} ST
\]

\[
VT = \frac{1}{2} ST
\]

\[
UW = VT = 81
\]
### 6.4 THE TRIANGLE MIDSEGMENT THEOREM

- **Given:** \( CF = FB \) and \( CD = DA \)
- **Prove:** \( DF \parallel AB \)

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>( CF = FB, CD = DA )</td>
<td>(given)</td>
</tr>
<tr>
<td>F is midpoint of CB, D is midpoint of AC</td>
<td>(def. Midpoint)</td>
</tr>
<tr>
<td>DF is midsegment</td>
<td>(def. Midsegment)</td>
</tr>
<tr>
<td>DF \parallel AB</td>
<td>(Midsegment Theorem)</td>
</tr>
</tbody>
</table>

Try #6
After this lesson...

- I can write indirect proofs.
- I can order the angles of a triangle given the side lengths.
- I can order the side lengths of a triangle given the angle measures.
- I can determine possible side lengths of triangles.
6.5 INDIRECT PROOF AND INEQUALITIES IN ONE TRIANGLE

- Indirect Reasoning
  - You are taking a multiple choice test.
  - You don’t know the correct answer.
  - You eliminate the answers you know are incorrect.
  - The answer that is left is the correct answer.
  - You can use the same type of logic to prove geometric things.
6.5 INDIRECT PROOF AND INEQUALITIES IN ONE TRIANGLE

• **Indirect Proof**
  • Proving things by making an assumption and showing that the assumption leads to a contradiction.
  • Essentially it is proof by eliminating all the other possibilities.
Steps for writing indirect proofs

1. Identify what you are trying to prove. Temporarily, assume the conclusion is false and that the opposite is true.
2. Show that this leads to a contradiction of the hypothesis or some other fact.
3. Point out that the assumption must be false, so the conclusion must be true.
• Suppose you wanted to prove the statement “If $x + y \neq 14$ and $y = 5$, then $x \neq 9$.” What temporary assumption could you make to prove the conclusion indirectly?

• Try #2

Assume $x = 9$

If $x = 9$, then $x + y \neq 14$. $9 + 5 \neq 14 \rightarrow 14 \neq 14$. This is the contradiction
Write an indirect proof that if two lines are *not* parallel, then consecutive interior angles are *not* supplementary.

*Given* Line $\ell$ is not parallel to line $k$.

*Prove* $\angle 3$ and $\angle 5$ are not supplementary.

Assume temporarily that $\angle 3$ and $\angle 5$ are supplementary.
By the Converse of the Consecutive Interior Angles Theorem, line $\ell$ is parallel to line $k$.
This contradicts the given information.
So, the assumption that $\angle 3$ and $\angle 5$ are supplementary must be false, which proves that $\angle 3$ and $\angle 5$ are not supplementary.
6.5 INDIRECT PROOF AND INEQUALITIES IN ONE TRIANGLE

• Draw a scalene triangle
• Measure the sides
• Measure the angles
• What do you notice?

• Smallest side opposite _______
• Largest angle opposite _______

Smallest angle
Largest side
6.5 INDIRECT PROOF AND INEQUALITIES IN ONE TRIANGLE

### Big Angle Opposite Big Side Theorem

If one side of a triangle is longer than another side, then the angle opposite the longer side is larger than the angle opposite the shorter side.

### Big Side Opposite Big Angle Theorem

If one angle of a triangle is larger than another angle, then the side opposite the larger angle is longer than the side opposite the smaller angle.

- List the sides in order from shortest to longest.
- Try #16

ST, RS, RT
Triangle Inequality Theorem

The sum of two sides of a triangle is greater than the length of the third side.

\[ AB + BC > AC; \ AB + AC > BC; \ BC + AC > AB \]

Can’t be done, short side don’t touch
Can’t be done, forms a line
Can be done, isosceles triangle
A triangle has one side of 11 inches and another of 15 inches. Describe the possible lengths of the third side.

Try #20, 24

\[11 + x > 15 \rightarrow x > 4\]
\[15 + x > 11 \rightarrow x > -4 \text{ (already part of } x > 4)\]
\[11 + 15 > x \rightarrow 26 > x\]

Combine 1\textsuperscript{st} and 3\textsuperscript{rd}: \(4 < x < 26\)

Short cut: subtract to get smallest, add to get largest
6.6 INEQUALITIES IN TWO TRIANGLES

After this lesson...
• I can explain the Hinge Theorem.
• I can compare measures in triangles.
• I can solve real-life problems using the Hinge Theorem.
6.6 INEQUALITIES IN TWO TRIANGLES

• See Mr. Wright’s demonstration with the meter sticks.

• How does the third side compare when there is a small angle to a big angle?

Use two meter sticks to demonstrate the Hinge Theorem
Have two meter sticks form two sides of the Δ and have the kids imagine the third side.
6.6 INEQUALITIES IN TWO TRIANGLES

Hinge Theorem

If 2 sides of one $\Delta$ are congruent to 2 sides of another $\Delta$, and the included angle of the 1$^{st}$ $\Delta$ is larger than the included angle of the 2$^{nd}$ $\Delta$, then the 3$^{rd}$ side of the 1$^{st}$ $\Delta$ is longer than the 3$^{rd}$ side of the 2$^{nd}$ $\Delta$. 

[Diagram with angles and sides]
Converse of the Hinge Theorem

If 2 sides of one Δ are congruent to 2 sides of another Δ, and the 3\textsuperscript{rd} side of the first is longer than the 3\textsuperscript{rd} side of the 2\textsuperscript{nd} Δ, then the included angle of the 1\textsuperscript{st} Δ is larger than the included angle of the 2\textsuperscript{nd} Δ.
6.6 INEQUALITIES IN TWO TRIANGLES

- If $PR = PS$ and $m \angle QPR > m \angle QPS$, which is longer, $SQ$ or $RQ$?

- If $PR = PS$ and $RQ < SQ$, which is larger, $m \angle RPQ$ or $m \angle SPQ$?

- Try #2, 6
6.6 INEQUALITIES IN TWO TRIANGLES

- Given: \( AB \cong BC, AD > CD \)
- Prove: \( m\angle ABD > m\angle CBD \)

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>( AB \cong BC, AD &gt; CD )</td>
<td>(given)</td>
</tr>
<tr>
<td>( BD \cong BD )</td>
<td>(Reflexive)</td>
</tr>
<tr>
<td>( m\angle ABD &gt; m\angle CBD )</td>
<td>(Converse of Hinge Theorem)</td>
</tr>
</tbody>
</table>
Two groups of joggers leave the same starting location heading in opposite directions. Each group travels 2 miles, then changes direction and travels 1 mile. Group A starts due north then turns 35° toward west. Group B starts due south then turns 25° toward east. Which group is farther from the start location? Explain your reasoning.

Group B; The measure of the included angle for Group B is 155°, which is greater than the measure of the included angle for Group A. So, Group B is farther from camp.
