## 1-04 Functions and Functional Notation

### Relation

- Rule that relates \_\_\_\_\_

### Function

- Special \_\_\_\_\_
- A function  $f$  from set A to set B is a relation that assigns each element  $x$  in set A to \_\_\_\_\_ one element in set B
- Set A: \_\_\_\_\_, \_\_\_\_\_
- Set B: \_\_\_\_\_, \_\_\_\_\_

Is this a function?

$x$	-2	-1	0	1	2
$y$	-8	-1	0	1	8

$$x^2 + y = 4$$

$$x + y^2 = 16$$

### Functional Notation

$$f(x) = x^2 + 4$$

If  $f(y) = 3 - \sqrt{y}$ , evaluate

$$f(4)$$

$$f(4x^2)$$

### Piecewise functions

- Function made of \_\_\_\_\_ function with specific \_\_\_\_\_

$$f(x) = \begin{cases} 2x + 1, & x < 0 \\ 2x + 2, & x \geq 0 \end{cases}$$

Evaluate  $f(-1)$

$$f(2)$$

**Domain of a function**

- Implied domain - all real numbers for which the expression is \_\_\_\_\_

**Interval notation**

- [ ] means \_\_\_\_\_
- ( ) means \_\_\_\_\_
- [2, 7] means \_\_\_\_\_

What is the domain?

$$h(t) = \frac{4}{t}$$

$$f(x) = \sqrt{5x - 8}$$

**Difference Quotient**

$$\frac{f(x + h) - f(x)}{h}$$

Simplify the difference quotient for  $f(x) = 2x + 1$
